An obvious and intriguing aspect of vector research is why so few nematode species are apparently capable of transmitting plant viruses and,

equally, why such a restricted range and number of viruses have nematodes as their natural vector. A principal feature of these relationships is the apparent specificity between the virus and its vector.

2 Plant viruses. Viruses contain a nucleic acid core surrounded by a capsid (a layer of protein). Viral capsids are composed of large numbers of protein subunits, which can be exploited for diverse applications. Plant viruses are obligate parasites on their host plants and utilize plant proteins for their own purposes [17]. As plant viruses are
